Third Stage:

Other emerging issues

• First Stage:

Gather advance information

Information of the potential sites:

- Data availability (GIS, satellite)
- Maps with geologic/geographic/bathymetric/topographic/navigational and hydrographic data (!)
- Previous usages, future plans by the local community
- Other stakeholders
- Jurisdiction and regulations (current/future use) (!)

Information of the local area (land-based):

- Accessibility from land (roads, harbour, electricity, phone cables, land-based facilities, etc.) (!)
- Experiences/educated workers available (!)
- Equipment available (spare parts, farm harness) (!)
- Subcontractors available (deployment at sea, security, harvest vessels, further processing, transport, etc.)
- proximity to processing plants, airport, other ports, markets
- Community related support: Permit, taxation and cofinance (!) First sites selected

Site-specific and oceanographic parameter:

Second Stage:

Environmental

assessment and

baseline,

monitoring

- Current velocity, wave height, and direction (!)
- Year-round climate conditions (wind exposure, fetch, storm conditions, ice drift, etc.) (!)
- Depth and seafloor conditions (!)
- Distance from shore and tides (!)

Water quality parameter:

- Temperature, pH and salinity regime
- Oxygen/nutrient concentrations (!)
- Turbidity and attenuation
- Effects of river run-offs
- Red tides and plankton blooms
- Predators

Other important requirements:

- Potential of expansion
- Technical feasibility (!)
- Economic feasibility (!)

Aquaculture Perspective of Multi-Use Sites in the Open Ocean

The Untapped Potential for Marine Resources in the Anthropocene

Editors: Buck, Bela H., Langan, Richard (Eds.)

The first-of-its-kind compilation that comprehensively explores the scientific, engineering, economic and policy aspects of marine aquaculture multi-use of offshore platforms

A timely analysis of the rapid development of offshore energy production platforms and the massive projected global seafood deficit

Individual chapters written contemporaneously with EU "Oceans of Tomorrow" developments as well as proposals by the Food and Agriculture Organization (FAO), authored by highly-respected, international experts in the field

Energy from Open Ocean Kelp Farms

Office of Technology Assessment United States Congress

Large ocean energy farms may one day prove to be an alternative source of synthetic natural gas for homes and businesses. Research into new ocean biomass energy systems has been reviewed here by the Office of Technology Assessment of the United States Congress, with the assistance of specialists in the research and development aspects of ocean farming. This report presents the status of ocean energy farm developments and evaluates their potential. While ocean energy farms are now in the early stages of development and much research remains to be done, the prospects are encouraging. This book contains descriptive and analytic material concerning ocean biomass resources; potential for future ocean farms; technologies of ocean farming; existing government and private efforts; energy and economic data; environmental effects and legal aspects; and future research needs.
